Abstract

This thorn is a test driver for the `Util_Table*`() key/value-tables API.

1 Introduction

Cactus defines a set of `Util_Table*`() functions to manipulate key/value tables. (Chapter C of the Cactus Users' Guide contains a tutorial description of how to use these.)

This thorn is a test driver for these functions. It has no parameters; just activate it to run the tests. It will print out a bunch of messages (so you can see where it was if something goes wrong). If Cactus exits normally all the tests passed; any test failures will result in an `assert()` failure (which typically gives a core dump).
